Subject Impact of high-level services upon CSS

## Description of Problem or Suggestion:

Several services (for example, subscriptions, URs, session management) have been presented which will have a significant impact upon CSS Services. The physical (hardware and network) impact of these services must be determined to ensure that the object-level design can be realized.

## Originator's Recommendation

1) Designers/developers of services which rely heavily upon CSS should work with CSS to determine impact and, if necessary, consider alternatives.

2) Overall sizing requirements for CSS should be re-evaluated in light of additional high-level service usage.

HAIS Response Date 11/22/95

Release B Infrastructure Development Group (IDG) agrees that various Release B subsystems use the infrastructure services (URs, subscriptions, session management, request tracking and other CSS services) and will have design/sizing impact on these services. ECS will examine these services and findings/results will be presented at a Infrastructure min-review during early Feb' 96
